

*ECOsysteM Spaceborne Thermal Radiometer  
Experiment on Space Station*

Simon J. Hook and the ECOSTRESS Team  
Jet Propulsion Laboratory,  
California Institute of Technology, Pasadena, CA

With support, encouragement and participation from many!

## ECOsysteM Spaceborne Thermal Radiometer Experiment on Space Station

Dr. Simon J. Hook, JPL, Principal Investigator

### Science Objectives

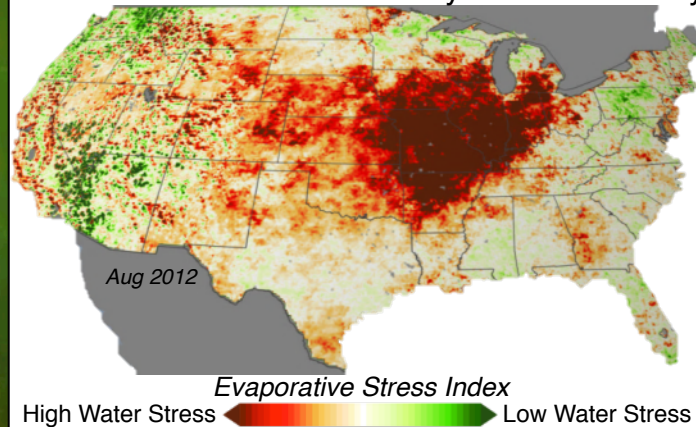

- Identify **critical thresholds of water use and water stress** in key climate-sensitive biomes
- Detect the timing, location, and predictive factors leading to plant **water uptake decline** and/or cessation over the **diurnal cycle**
- Measure **agricultural water consumptive use** over the contiguous United States (CONUS) at spatiotemporal scales applicable to improve drought estimation accuracy

#### Water Stress Drives Plant Behavior

When stomata close, CO<sub>2</sub> uptake and evapotranspiration are halted and plants risk starvation, overheating and death.

#### Water Stress Threatens Ecosystem Productivity

Water stress is quantified by the Evaporative Stress Index, which relies on evapotranspiration measurements.

ECOSTRESS will provide critical insight into **plant-water dynamics** and how **ecosystems change with climate** via **high spatiotemporal** resolution thermal infrared radiometer measurements of evapotranspiration from the International Space Station (ISS).

## Mission

- Class D \$30M cost cap
- 31-months from project start to delivery
- JPL implementation and management
- 69-month project duration (Phase A-F)
- On ISS-JEMS Module
- 12-month Science Operations (Phase E)

The inclined, precessing ISS orbit enables ECOSTRESS to sample the diurnal cycle in critical regions across the globe at spatiotemporal scales missed by current instruments in Sun-synchronous polar and high-altitude geostationary orbits.

## Instrument

- Leverages functionally-tested PHYTIR space-ready hardware developed under the NASA Instrument Incubator Program:
  - Spectral resolution: 5 bands in the thermal infrared window (8-12.5  $\mu\text{m}$ ) part of the electromagnetic spectrum
  - Noise equivalent delta temperature:  $\leq 0.3$  K
  - Spatial resolution: 38 m x 69 m
  - Swath width: 400 km @ 400 km altitude ( $51^\circ$ )
- Well understood measurement and algorithms based on prior missions, such as ASTER, MODIS, and Landsat

## Push-whisk System

## Science Data Products

L0	Raw data
L1	Radiometrically corrected Brightness Temperature
L2	Surface Temperature and Emissivity
L3	Evapotranspiration
L4	Water Use Efficiency, Evaporative Stress Index

## Science Team

**Principal Investigator**

Simon Hook, JPL

**Co-Investigators**

Rick Allen, Univ. of Idaho

Martha Anderson, USDA

Joshua Fisher, JPL

Andrew French, USDA

Glynn Hulley, JPL

Eric Wood, Princeton Univ.

**Collaborators**

Christopher Hain, Univ. Maryland

## Project Status Summary

<u>Technical</u>			<u>Schedule</u>			<u>Programmatic</u>			<u>Resources</u>		
FEB	MAR	APR	FEB	MAR	APR	FEB	MAR	APR	JAN	FEB	MAR
Y	Y	Y	Y	Y	Y	G	G	G	Y	Y	G

### Detailed Description: (for items identified as yellow or red)

**Technical:** Firmware on DPU-I/O has limited data band-width, data compression not implemented/working and data sent to GDS was not readable during thermal ambient test.

SpX changed the interface design to the Dragon Trunk from pFSE 1.0 to 2.0 design. Still evaluating the changes needed to random vibration testing MGSE.

**Schedule:** Cryocooler Multiplexer (CCM) would not switch from side-A to side-B of redundant cryocooler electronics. Request to change the delivery schedule submitted to ESSPO.

No Current Problem  
All commitments can be met

Significant problem  
Identified solution  
Commitment is in jeopardy

Major Problem  
No identified solution  
Commitments cannot be met

# Mass

- Updated as-build mass of MSU, CCM, PCE and Close-out Panel.

# Power

- FPIE power updated with measured power.

Power Consumption History

# EM Cryocooler Installation

# ECOSTRESS Electronics Development

1. Focal Plane Interface assembly
2. Cryocooler multiplexer assembly
3. Central electronics unit
4. WiFi electronics box assembly
5. Mass storage unit
6. Cryocooler electronics
7. Power condition
8. Radiometer Instrument
9. Nadir Panel
10. GSE Hot Plate

ECOSTRESS electronics ambient thermal cycling test configuration

# ECOSTRESS

- Some facts and figures
  - Focused on water use and availability
  - Selected in EVI-2
  - Class D mission on ISS
  - Uses PHyTIR developed under ESTO IIP
  - Deliver in early 2017
  - Launch in mid 2018
  - Nominal mission lifetime 1 year

# L1 Science Requirements and Margins

Parameter	Science Requirement (from PLRA)	Current Best Estimate @ 400 km
Ground Sample Distance (m) Crosstrack x Downtrack at nadir	$\leq 100 \times \leq 100$	68.5 x 38.5
Swath width (ISS nominal altitude range is 385 to 415 km)	$\geq 360$	402
Wavelength range ( $\mu\text{m}$ )	8-12.5	8-12.5
Number of bands	$\geq 3$	5 TIR + 1 SWIR
Radiometric accuracy (K @300K)	$\leq 1$	0.5
Radiometric precision (K @300K)	$\leq 0.3$	0.15-0.25
Dynamic Range (K)	270-335	200-500
Data collection	CONUS, twelve 1,000 x1,000km key climate biomes and twenty-five FLUXNET sites. On average 1 hour of science data per day.	1.5 hours per day of science data

# ECOSTRESS Science Data Products

Data Product	Description	Initial Availability to NASA DAAC	Median Latency in Product Availability to NASA DAAC after Initial Delivery	NASA DAAC Location
<b>Level 0</b>	Raw collected telemetry	6 months after IOC	12 weeks	LPDAAC
<b>Level 1</b>	Calibrated Geolocated Radiances	6 months after IOC	12 weeks	LPDAAC
<b>Level 2</b>	Surface temperature and emissivity	6 months after Level 1 data products are available	12 weeks	LPDAAC
<b>Level 3</b>	Evapotranspiration	2 months after Level 2 data products are available	12 weeks	LPDAAC
<b>Level 4</b>	Water use efficiency and evaporative stress index	2 months after Level 3 data products are available	12 weeks	LPDAAC

# Calibration and Validation

- On-board blackbodies
- Vicarious calibration sites
- Validation sites (FLUXNET)

Lake Tahoe

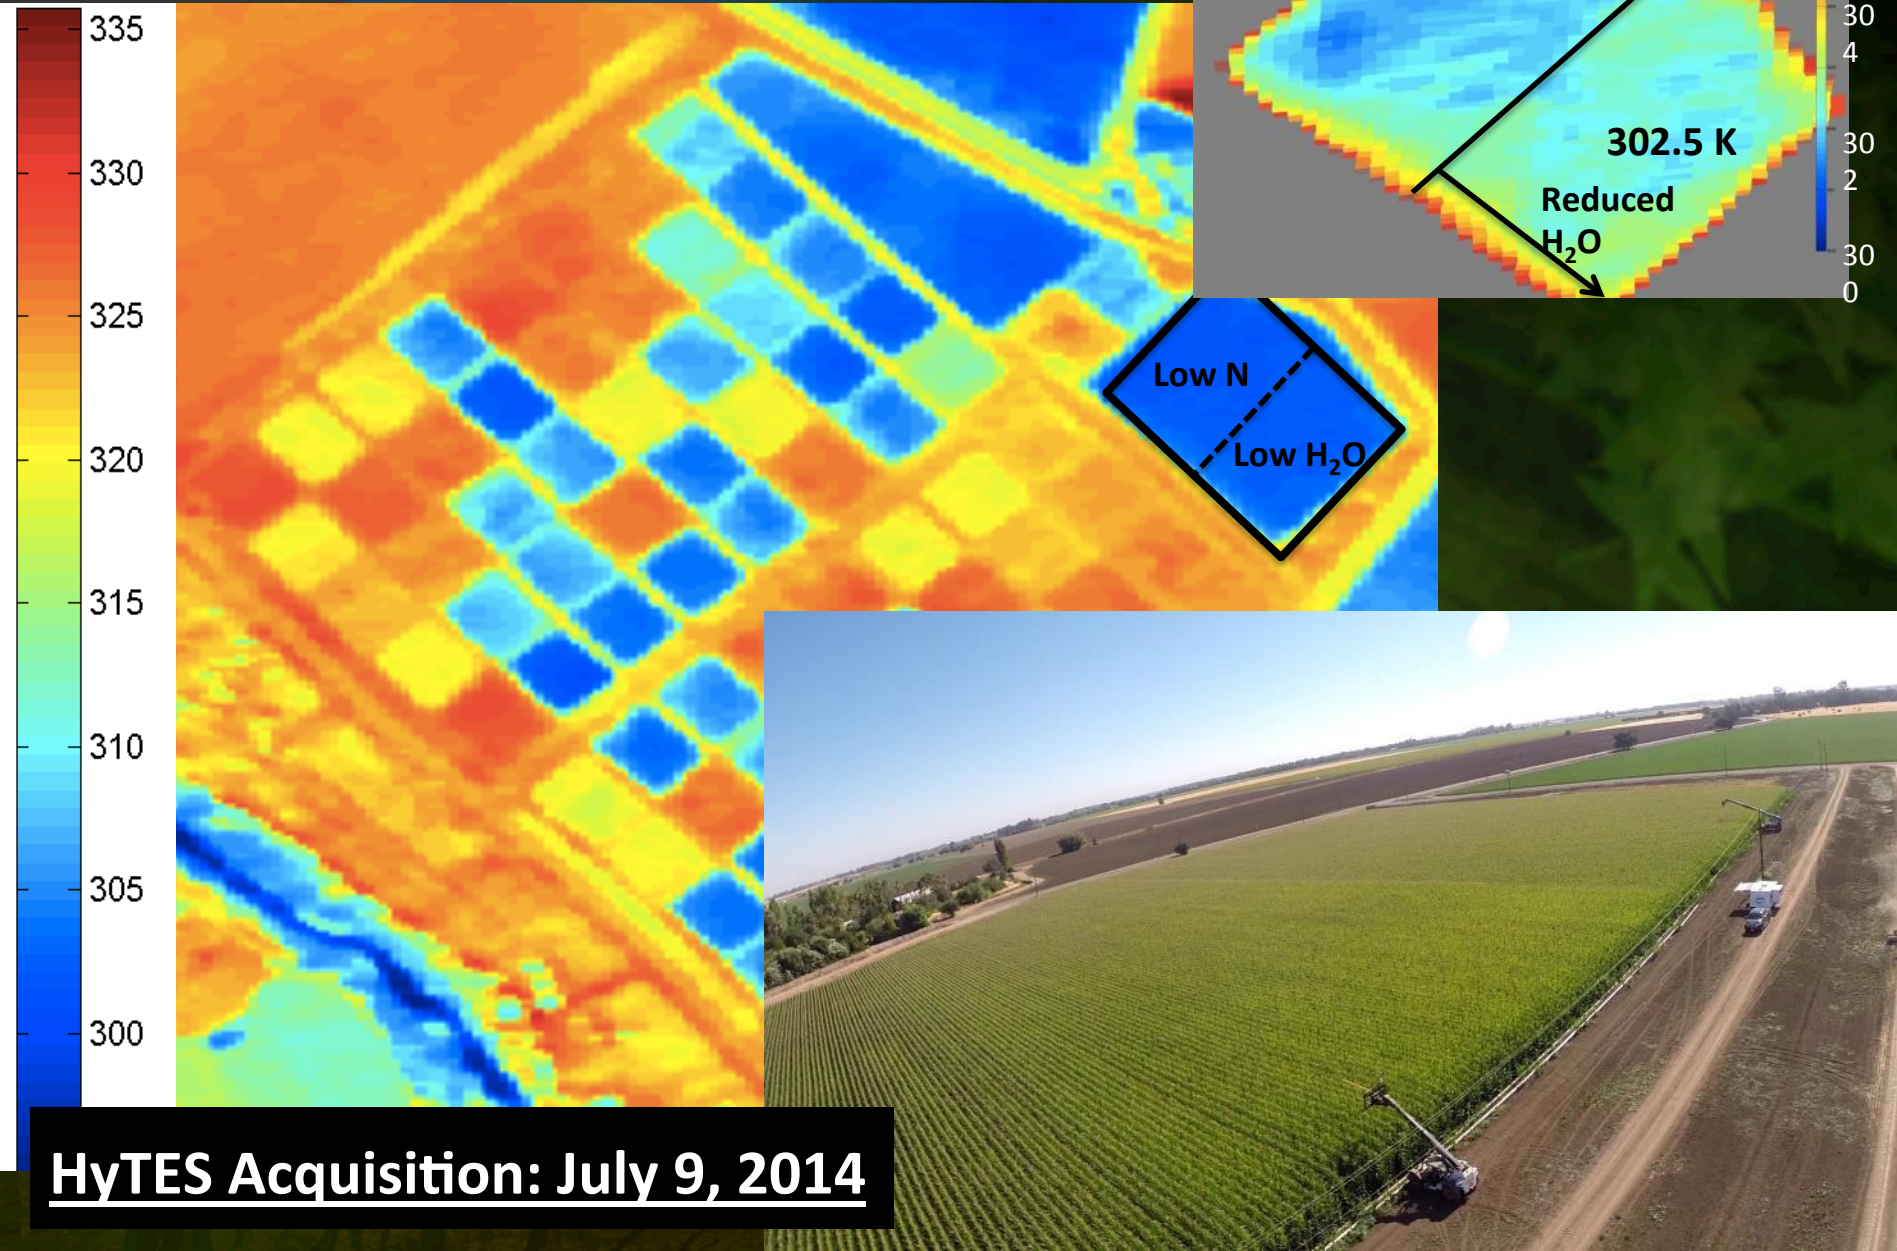

Russell  
Ranch

Tonzi Ranch  
(23 m tower)

# Using JPL Airborne Instruments for Precursor Studies:

# Summary

- ECOSTRESS is possible because of the development of the PHyTIR instrument for HypsIRI-TIR supported by ESTO
- ECOSTRESS will address a subset of the science associated with HypsIRI
- The ECOSTRESS mission will help answer three key science questions:
  - How is the terrestrial biosphere responding to changes in water availability?
  - How do changes in diurnal vegetation water stress impact the global carbon cycle?
  - Can agricultural vulnerability be reduced through advanced monitoring of agricultural water consumptive use and improved drought estimation?
- ECOSTRESS has a clearly defined set of data products and mature algorithms
- Opportunity for combined HypsIRI-like datasets using the European EnMAP/PRISM and ECOSTRESS with GEDI for structure

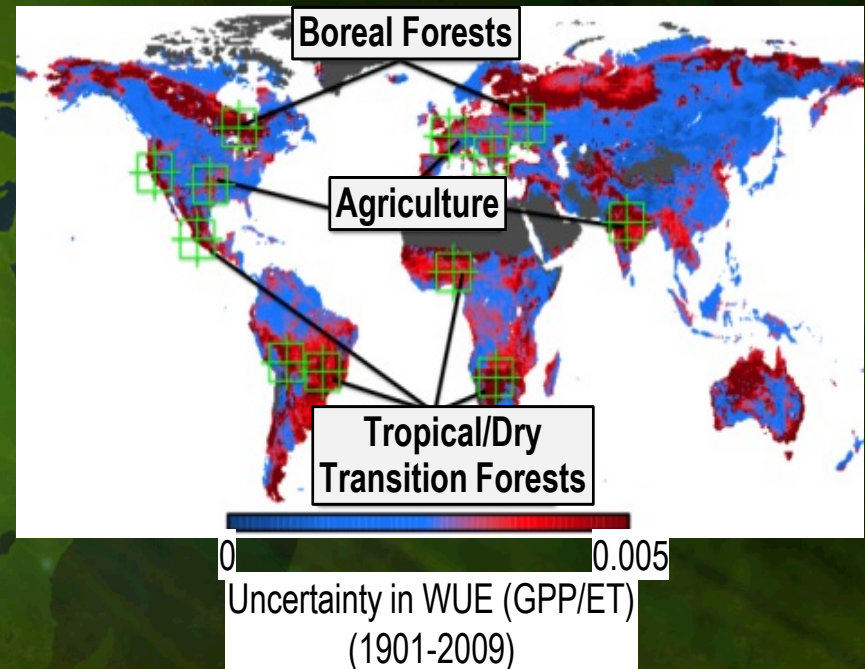

ECOSTRESS will launch in 2018 and provide highest spatial resolution thermal infrared data ever from the International Space Station. HypsIRI is planned for the 2023+ timeframe unless the Decadal Survey increases the priority !!

The background of the slide is a composite image. In the center is a large, semi-transparent globe of the Earth, showing the continents of North America, South America, and Africa. The globe has a green tint. Behind the globe is a dark, dense forest of tall trees. The word "BACKUP" is written in white, bold, sans-serif capital letters across the center of the globe.

BACKUP

# Q1. How is the terrestrial biosphere responding to changes in water availability?

**Uncertainty in our knowledge of carbon response is directly dependent on water response uncertainty and how plants use water under drying conditions.**

Red areas (“hotspots”) are where global models disagree on water use efficiency (WUE) based biome changes with climate change. ECOSTRESS will reduce this uncertainty with measurements for WUE (GPP/ET).

## Q2. How do changes in diurnal vegetation water stress impact the global carbon cycle?

ECOSTRESS acquires numerous samples throughout the day over 1 year (at 50° latitude shown, for example).

ECOSTRESS's diurnal sampling measures the shape of the daily ET cycle. The afternoon decline in ET is related to water stress (clear day).

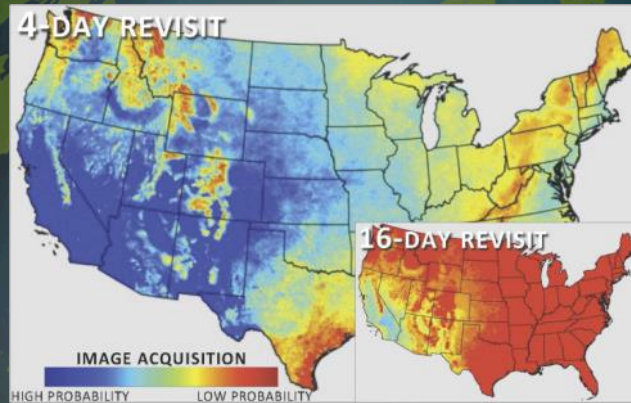

I: Xylem refilling after initial water release.

II: ET at maximum/potential rate in the morning.

III: Stomata shut down water flux in the afternoon.

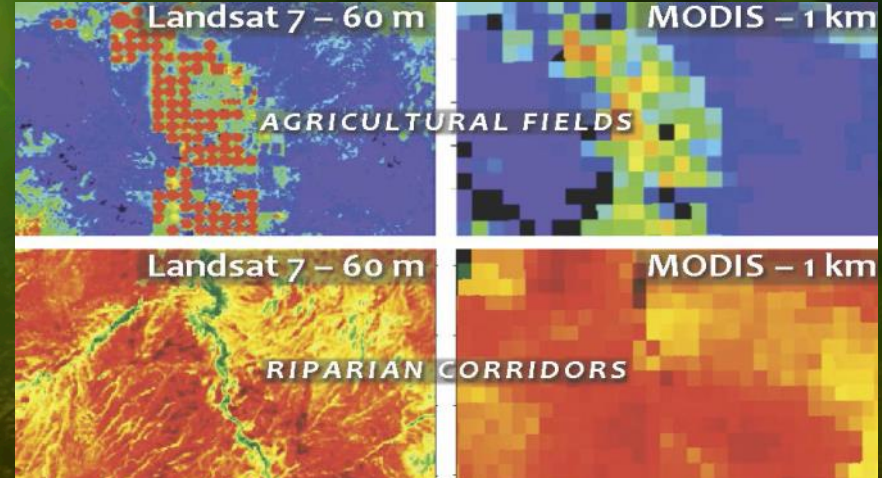

IV: ET resumes at maximum/potential in early evening when demand is reduced

# Q3. Can agricultural vulnerability be reduced through advanced monitoring of agricultural water consumptive use and improved drought estimation?

ECOSTRESS's spatial resolution will distinguish fine-scale landscape heterogeneity such as agricultural systems (top) and riparian corridors (bottom) similar to Landsat (left), whereas MODIS (right) does not.

Probability of producing valid ET estimates when satellite revisit time is 16 days (lower-right inset) vs. 4 days

ECOSTRESS's temporal resolution provides a *9-fold* decrease in ET error relative to Landsat.

# HyTES: Hyperspectral Thermal Emission Spectrometer

## JPL Airborne Capability

Image Acquisition: 9 JUL 2014

# HyTES Acquisition: July 9, 2014

## Irrigated July 7-8:

 Organic Tomato

→ Mean LST = 309 K

 Conventional Tomato

→ Mean LST = 306 K

## Irrigated July 2-3:

 Organic Corn

→ Mean LST = 304 K

 Conventional Corn

→ Mean LST = 303 K

 Alfalfa

→ Mean LST = 301.5 K
